Disabling WProofreader in source mode of WYSIWYG editors

Quite often we receive requests from our clients asking how to disable the proofreading option in the source mode of a rich text editor and keep it enabled only in the WYSIWYG mode. In general, for such cases, we offer a special option **disableAutoSearchIn** of WProofreader that allows disabling it for certain cases (class, id, data attribute name and HTML elements).

Disabling WProofreader in Source Mode of CKEditor 4

The source mode of CKEditor 4 has a special CSS class '**.cke_source**'. You can rely on this class and disable WProofreader using the **disableAutoSearchIn** option with this class specified as in the example below.

```
<script>
        window.WEBSPELLCHECKER_CONFIG = {
                    ....
                    disableAutoSearchIn: ['.cke_source']
                   ....
        };
</script>
```

[Resolved]

WProofreader was disabled by default for CKEditor 4 source mode in release 5.5.2 effective date August 16, 2019.
