

Migrating from WebSpellChecker Cloud to Server Application

WebSpellChecker enables **Cloud** and **Server** solutions for installing and hosting its products.

WebSpellChecker Cloud Services

With the **Cloud version**, the WebSpellChecker products are hosted and running on WebSpellChecker Cloud. There is no need to worry about maintaining your own infrastructure and digging into technical details trying to install and configure it. Moreover, Cloud services subscription includes automated software updates, technical support, hosting costs, and system administration.

- Annual subscription at fair and reasonable price
- Simplified Integration. Easy to get started
- Automatic application upgrades and access to the latest features
- Statistics monitoring and service management tool
- Professional technical support during the year

WebSpellChecker Cloud Services are provided with certain usage limitations. Refer to [Difference overview of Cloud vs On-Premise](#) to find out more.

WebSpellChecker Server

The **Server version** of WebSpellChecker application is installed and running on your own servers*. Unlike the Cloud version, it provides more control over the application and better level of data security as you know where your data is going and where it resides.

- A license cost is formed based on the number of users (user tiers).
- No limit on the text processed
- High level of data security. All the data processed and stored on your servers
- Advanced application management and control
- Extended languages list and configurable features
- Quarterly application upgrades and maintenance
- Custom functionality on demand
- Timely and professional technical support

The server version supports installation on Windows or Linux-based environments with properly configured web or application server. Check our [Software requirements](#) to find out more.

Good to know:

- You may [sign up for 30-day free trial](#) of WebSpellChecker Server to evaluate whether the Server version meets your requirements.
- Before installing WebSpellChecker Server, check [Software requirements](#).

1. Obtain Trial or Commercial Server License

To migrate from free or paid version of the Cloud Services, you need to obtain a separate commercial license for the Server version of WebSpellChecker. Depending on your needs, you can start from 30-day evaluation license or obtain a commercial license to WebSpellChecker Server.

2. Install WebSpellChecker Server

Install and configure WebSpellChecker Server following the steps described in one of the guides below.

Install WebSpellChecker Server on a Linux server

Install WebSpellChecker Server on a Windows server

3. Update Your Integration Code from Cloud to Server

As soon as WebSpellChecker Server is successfully installed and configured, and a license is activated, you can switch the previous integration from Cloud to the Server version. Basically, on this step you need to change the path from WebSpellChecker Cloud to WebSpellChecker Server that is installed and running on your side. Thus, all the spelling and grammar check requests from your application will be processed by WebSpellChecker Server installed on your side.

Depending on the product and integration you use, check one of the manuals below:

Still have a question?

Please feel free to contact our [technical team](#) if you are having any difficulties with the configuration.
