

# How to subscribe to `addWordToUserDictionary` and `deleteWordFromUserDictionary` action

There are separate callback functions available such as `onAddWordToUserDictionary` and `onDeleteWordFromUserDictionary`, that you can use to get information about newly added or removed words from the personal user dictionaries.

```
</script>
window.WEBSPELLCHECKER_CONFIG = {
  ...
  onAddWordToUserDictionary: function(word, instance) {
    console.log(word);
  },
  onDeleteWordFromUserDictionary: function(word, instance) {
    console.log(word);
  }
};
</script>
```

For the versions of the package before release 5.5.8, there is a temporary workaround available if you need to listen to Add or remove word actions performed by end users.

```
<script>
window.WEBSPELLCHECKER_CONFIG = {
  autoSearch: true,
  ....,
  onLoad: function(instance) {
    instance.subscribe('addWordToUserDictionary', function(data) {
      // Get the added `word` from `data.word` field
    });

    instance.subscribe('deleteWordFromUserDictionary', function(data) {
      // Get the deleted `word` from `data.word` field
    });
  }
};
</script>
```
